

按一下以新增標題

- › A package in Java is used to group related classes
 - thinking of it as a folder in a file directory
 - uses packages to avoid name conflicts
 - writes a better maintainable code
- Packages are divided into two categories:
 - › Built-in Packages (packages from the Java API)
 - for example, the Scanner class
 - › User-defined Packages (create your own packages)

```
import java.util. Scanner
```

```
import java.util.*
```

1140521 package.pdf

› Attention!!!

- Import fjc.*;
 - Import fjc.miia;
 - Import fjc.aiis;
- } 只引入資料夾，但底下檔案不被引入

- Import fjc.miia.programming; → be not contained
- Import fjc.aiis.programming; → be not contained

```
import fjc.miia.*
        aiis
```
